

Cypress Island State Aquatic Reserve

Extreme care was used during the compilation of this map to ensure accuracy. However, due to changes in data and the need to rely on outside sources of information, the Department of Natural Resources cannot accept responsibility for errors or omissions, and, therefore, there are no warranties which accompany this material.

Cypress Island is an outstanding example of a pristine San Juan Archipelago island ecosystem. The water around Cypress Island provides a unique blend of habitats, including intertidal and subtidal rocky reef habitats, unconsolidated subtidal habitats, pocket beaches, mixed coarse and mixed fine beaches, and protected embayments. The Cypress Island ecosystem supports commercial and non-commercial populations of invertebrates, fish and wildlife including threatened and/or endangered species protected under the Endangered Species Act, such as bald eagle, peregrine falcon and Puget Sound Chinook salmon. The aquatic reserve linked with the upland Natural Resource Conservation Area will ensure protection of this pristine system.
